What Is HTML

Hyper Text Markup Language or [HTML](#) is a coding language that is used by developers to create webpages and web applications. If you want a more in-depth look at HTML and the relationship between [HTML and CSS](#), you may use any of the [HTML samples](#), [cheatsheets](#), examples, and [PDFs](#) on the list above.

How to Build an HTML Using Notepad

Coding and using [HTML](#) will take some time and mastery over the markup language. A good way to practice this is by [creating an HTML](#) Website in notepad.

1.) Open Notepad on Your PC

Begin by opening the notepad application on your PC. This can be accessed by pressing the windows button on the lower left of your start bar and typing notepad on the search bar.

2.) Write Basic HTML Code

Be sure to type everything accurately and in order, the spaces between the two codes should be a break, which is achievable by pressing the enter button after the [code](#).

3.) Personalize the Title

When you have finished writing the [basic HTML](#) code, you can now edit the page title and the heading that will precede the title of the HTML. The title and the heading could span any length and the heading will use the heading 1 format. To change the heading format, you must edit the number in the heading code.

4.) Edit the Paragraph

After personalizing the title and the heading, you must now edit the paragraph of the HTML. Edit the "this is a paragraph" text in the code.

5.) Save the HTML Document

When you have finished personalizing the simple HTML code, you will now save the document. Click the file on the header of the notepad, and select the save as button. This will open a separate window where you will enter the name as "Name of the HTML.html", be sure to change the Save as Type option to All files.

FAQs

What is HTML 5?

HTML 5 is the most recent [HTML](#), which is a markup language available on the internet. This marks the fifth and final major iteration of HTML. HTML 5 was released on January 22, 2008, and has continuously gotten updates to its framework and structure. The HTML 5 can consistently work without the need for an internet connection and can host high-quality pictures, videos, graphics, and animations. This markup language is supported by most of the internet browsers that are available in the market. HTML 5 has currently supplanted Adobe Flash in the market, which has caused Adobe Flash to stop being supported by Adobe. Even though Adobe Flash has functions that HTML 5 has.

How do I change the color of my HTML?

HTML webpages allow users to customize different facets of their webpage. This means that they can use color codes to insert a specific type of color into the web page's background, text, and banner. There are around 256 shades and hues of color that is available for the user to use on their webpage, by obtaining the color's specific hexadecimal code and inputting it into the specific part of the code they may change the color of the chosen part of the webpage.

What is BeautifulSoup, and why is it important?

BeautifulSoup is a Python library that pulls the data from HTML or XML files and then sorts and organizes the code into different categories. This library will parse out the data and help coders seek out specific code in their coding structure. BeautifulSoup is one of the best python libraries coders use as it can save them so much time when they need to look for a specific string of code. Hyper Text Markup Language or HTML is a markup language for documents. This markup language is composed of various elements and structural semantics that the coders can use to create a webpage. In conclusion, a pro-coder can create wonderful webpages with just the utilization of HTML.
